PROJECTS

Mountains Hangman —

Mountains Hangman is a project that I made to work on my javascript skills with user input. Having a random mountain selected from array of objects.User will make guesses till they guess correctly or run out of guesses . Once the full name of the mountain was guessed then a picture of the mountain and where it is located would appear.

Space Trivia —

Space Trivia is a project that I made to work on my javascript skills with on click user input and javascript timers. Each question will have a time limit for the user to choose an answer. If the user picks a answer or time runs out the page will move on to display relevant information about the question, then after some more time passes the page will load the next question.

Liri Bot —

Liri is a command line node app that takes in one of four parameters and returns the relative data. Using various API's and node packages to grab and manipulate the data.
